Difference between TEM and TDM

TEM	TDM
The term TEM stand for Test environment management	The term TDM stand for Test Data management.
TEM helps to streamline delivery by providing a validated, stable and available environment to execute any test scenarios or replicate bugs.	Test data management, TDM, is a process that involves the design, planning, storage, and management of all kinds of test data.
Updating/deleting outdated test-environments	Decreases the risks of misplacement of the information.
Continuous monitoring test environments. Removing the outdated test environments and its tools , techniques and other details. Identifying test environment issues and resolving those issues.	Removing the corrupted data from earlier stage. Focusing on processing cost and storage and manage accordingly.
